MS2, feature pipeline

I have sadly not had the time to finish this milestone on time, so here is a brief overview of what has, and will happen.

Labeling
One SQL-query both finds and divides the sets into consecutive pairs.
The Prefect flow is only partially set up

Feature pipeline
I have found a nice library called music21 build at MIT to do exactly this kind of computer-assisted music analysis.
The implementation is not there, but the path to setting up functions to compute features based on music21-flows is very straight forward
Orchestration is not set up at all.

Ochestration and docker compose
The core containers are build and run imidiatly, while pipeline containers are only build and then run by Prefect.
This means we can have the pipelines in seperate containers, and Prefect can run them based on our flows. These flows can be run manualy, and at the moment, the ingestion of raw data is set up to run every monday early morning. When the other pipelines are done, we can string them onto this flow.

You can run “docker compose up” to start the entire system, all env default are set to work with one another without a .env file present. (example env will come later)
